

## METHOD AND SYSTEM FOR READING AUTHORIZED DATA

### ABSTRACT

A method and a system for reading authorized data are proposed. With a network connection established among a system for reading authorized data, a terminal device and an application service provider, the system for reading authorized data allows a user at the terminal device to obtain data generated by operating an application program system of the application service provider, wherein the system for reading authorized data is pre-formed with a database used for storing the data generated by operating the application program system. Therefore, the user merely submits a data-reading request to the system for reading authorized data, which retrieves data requested by the user from the database. In the foregoing method and system, no start-up program of the application service provider is necessarily installed in the terminal device, so that cost in purchasing authorization for using the application program system and load of the application program system are decreased.
